Dear Maxie:

We have received the referee's report for your article "Exact formulas for partial sums ...," which you submitted to Integers.

I am very sorry to say that, on the basis of the report, the Editors have decided not to accept your article for publication. The report is included below.

Thank you for considering Integers.

Best wishes,

Bruce Landman, Managing Editor
Integers

Let $g(n)$ be the Dirichlet convolution inverse of the function $\omega+1$. The author notes (Theorem 1.4) the existence of identities relating $M(x)$, the partial sums of the Mobius $\mu(n)$ function, to $G(x)$, the partial sums of $g(n)$. Attempts to understand $g(n)$ lead naturally to investigations of a function $C_{\{\Omega\}}(n)$, introduced by Froberg. Theorem 1.6 determines the mean value of $\log C_{\{\Omega\}}(n)$ while Theorem 1.8 proves that $\log C_{\{\Omega\}}(n)$ has a normal distribution after appropriate normalization.

I believe the results of the paper are new, and the proofs are certainly nontrivial. However, I don't feel I can recommend the paper for publication. The author does not do a sufficient job, in my opinion, convincing the readers that the results are interesting.

Understanding $M(x)$ is indeed a central problem in analytic number theory. However, while $G(x)$ is connected to $M(x)$ via the identities of Theorem 1.4, it is not clear that the author's results on $G(x)$ are likely to "filter down" to interesting results on $M(x)$. To be convinced the author is working in a productive direction, I would need to see a proof of concept: What new insights (theorems or testable predictions) re: the Mobius function are suggested by this approach?

Hello Bruce,

I have never authored an article titled "Exact formulas for partial sums ..." though I have worked quite a bit on generating function transformations over the years if that's what you meant. Incidentally, there are the following two preprint manuscripts available on arXiv:

1. <https://arxiv.org/abs/2102.05842>
2. <https://arxiv.org/abs/2604.23517>

The first is a text that I did submit to INTEGERS last year. Is that what you were referring to?

If the poorly formatted and, it seems to me, intentionally provocative and intentionally inflammatory referee report you pasted in the previous message is a coherent interpretation of the first article, then it seems to me that the referees wish is my command with the second manuscript. Incidentally, the second manuscript was published in the correct preprint archive this week - so timing is not a coincidence. Yesterday, I mentioned the submission to some roommates noting the positive impression on the journal I have frequently contributed to since 2017. Today, amidst other abnormal and unhealthy circumstances that we expect and largely accept without question in this fantasy world around Trump, this unfounded, poorly written and superficial opinion piece of the introduction section arrived at a power of 4 in the PM Central time. There is a long history to draw upon about this and other articles I have written. I have noted the lack of coincidence between these messages. I'm not disappointed, nor am I pissed off, nor am I truly speaking my free mind the way I really mean it as a civilian in this free country using the rights and freedoms granted to me by law in my native country. It's obviously intended to be inflammatory with a decision that is grounded on politics not merit. For that reason, I'm just going to ignore the decision and continue to openly question the integrity of INTEGERS and it's figurehead editors moving forward. I'm sorry to see you sink so low with the Trump-Musk regime, but I guess now that it's out in the open between us, I'm not going to miss you when you're gone.

N.b., the liberals and I in Chicago have been throwing around the idea of building a wall with Indiana to keep all those raving, impressionable rightwing nut jobs from illegally migrating into the city - raping and violently attacking our native people like the red migrants have never learned the difference nor that it's wrong (and that it's illegal as hell here). We think this is a first step to send the mob back across the border to Mike Pence, where they belong. I guess you're just going to have to get pissed when we deport you from our Land of Lincoln in the North. Wait three years, or let's call it six, when Trump finally serves out the rest of his life in prison for what is essentially tax evasion. Understand I didn't blindside you without the warning, which makes me better. It's coming, so, so sorry, sucker, you lose. She who laughs last: Ha (what a concept)! It all sounds like Fox News to me.

My first name is,

Maxie
